CONTENTS

1. GENERAL 15
1.1 Eurocodes 15
1.2 Units of measurement 16
1.3 Symbols 17

2. LIMIT STATES DESIGN
2.1 General 21
2.2 Actions on structures 21
2.2.1 Classification of actions 21
2.2.2 Nominal/ Characteristic values of loads 22
2.2.2.1 Materials self-weights 22
2.2.2.2 Floor coverings self-weights 22
2.2.2.3 Brick masonry loads 22
2.2.2.4 Imposed loads 24
2.2.2.5 Snow loads and wind loads 24
2.2.3 Design values of actions 24
2.2.3.1 Non-seismic actions 24
2.2.3.2 Seismic actions 25
2.2.4 Combinations of actions 25
2.2.5 Wind influence 26
2.2.6 Effects of indirect actions 26
2.3 Effects of actions 27
2.3.1 Deformation-stress definition of structures for combinations without seismic actions (STR/GEO) *[EC0, 6.4.1.]* 27
2.3.2 Deformation-stress definition of structures for combinations with seismic (or accidental) actions 28
2.3.3 Deformation-stress envelope definition 28
2.4 Strength of structural elements 28
2.5 Exercise 29

3. STRUCTURAL MODEL AND ANALYSIS 35
3.1 Structural model 35
3.1.1 Effective span of beams and slabs 35
3.1.2 Effective width of flanges 36
3.1.3 Rigit bodies 38

3.1.4 Diaphragmatic behaviour 40
3.2 Seismic loading model 41
3.3 Deformations - Stresses 44
3.3.1 Frame model 44
3.3.2 Slab analysis 45
3.3.3 Frame analysis 46
3.3.4 The effect of torsional stiffness on indirect beam-beam supports 56
3.3.5 Modelling floor diaphragms using two-dimensional finite elements 62
3.3.6 Modelling slabs using members and finite elements 64
3.3.6.1 The frame behaviour in regions of columns 66
3.3.6.2 Deflection of beams 68
3.3.6.3 Torsional stiffness of beams 70
3.3.6.4 Final conclusion 71

4 SLABS 75
4.1 General 75
4.2 Two-dimensional finite elements 77
4.2.1 Assumptions 77
4.2.2 Stress resultants and deflections 84
4.2.3 Unfavourable loadings and envelopes of stresses – deflections 116
4.2.4 Clarifications 129
4.3 Analyses using tables 134
4.3.1 Assumptions 134
4.3.2 Application width of concentrated load on slab 134
4.3.3 Distribution width of concentrated load 135
4.3.4 Support moments of continuous slabs 140
4.3.5 Contribution of pinned slab supports 141
4.4 Cantilevers 142
4.4.1 Static analysis 142
4.4.2 Deflection 142
4.5 One-way slabs 146
4.5.1 Static analysis 146
4.5.2 Deflection 150
4.5.3 Effective of live load on the static analysis of one-way slabs 154
4.5.3.1 Accurate analysis method 154

4.5.3.2 Simplified method for envelope estimation 162
4.6 Two-way slabs 163
4.6.1 Shear forces and support reaction forces 163
4.6.1.1 Simplified method 163
4.6.1.2 Czerny's elasticity method 166
4.6.2 Fundamental support and span moments – Deflections 167
4.6.2.1 MARCUS method 167
4.6.2.2 CZERNY's elasticity method 171
4.6.3 Bending moments in continuous two-way slabs 171
4.6.3.1 Continuous strip method 171
4.6.3.2 Accurate method (manual) 173
4.6.3.3 Practically accurate method 174
4.6.4 Influence of live load 174
4.7 Slabs supported on three edges 179
4.8 Slabs supported on two adjacent edges 179
4.9 Exercises 180

5. SEISMIC BEHAVIOUR OF FRAMES 209
5.1 One-storey plane frames (or coupled columns) 209
5.1.1 Bending and shearing effect on deformations and stresses 209
5.1.2 The degree of fixity effect of columns 212
5.1.3 The effect of columns moment of inertia 217
5.1.4 The effect of columns differential height 220
5.1.5 Frame column stiffness 224
5.1.5.1 One-storey frame structural systems 225
5.1.5.2 One-storey dual structural systems 229
5.2 Coupled one-storey plane frames 233
5.3 Multistorey plane frames 237
5.3.1 Multistorey plane frame systems 237
5.3.2 Multistorey plane dual systems 240
5.3.3 Comparison of multistorey frame and dual systems 242
5.4 Space frames 251
5.4.1 Diaphragmatic behaviour 251
5.4.2 Centre of mass and radius of gyration 252
5.4.3 Centre of stiffness and elastic displacements of the diaphragm 254
5.4.3.1 Subject description 254
5.4.3.2 Translation of centre of stiffness C_T along x direction 255

5.4.3.3 Translation of centre of stiffness C_T along y direction 256
5.4.3.4 Rotation of the diaphragm by an angle θ_z about C_T 257
5.4.3.5 Torsional stiffness ellipse, torsional radii and equivalent system 259
5.4.3.6 Work methodology 262
5.4.4 Assessment of building torsional behaviour..... 268
5.4.5 One-storey space frame with rectangular columns in parallel arrangement..... 269
5.4.5.1 Analysis using manual calculations, assuming fixed-ended columns (k=12) ..270
5.4.5.2 Analysis using the Excel file, assuming fixed-ended columns (k=12) 270
5.4.5.3 Analysis using the Excel file, assuming columns with k=6 270
5.4.5.4 Analysis using software, assuming actual beam and column torsional stiffnesses 270
5.4.6 Multistorey space frame of rectangular columns in parallel arrangement..... 274
5.4.6.1 Analysis using manual calculations, assuming fixed-ended columns (k=12) ..275
5.4.6.2 Analysis using the Excel file, assuming fixed-ended columns (k=12) 275
5.4.6.3 Analysis using the Excel file, assuming columns with k=6 275
5.4.6.4 Analysis using software, assuming actual beam and column torsional stiffnesses 275

5.4.7 Exercises 276

6. SEISMIC ACCELERATIONS AND LOADINGS OF BUILDINGS 291
6.1 Seismic response of buildings 291
6.1.1 Seismic zones *[EC8, §3.2.1]* 291
6.1.2 Importance factors *[EC8, §4.2.5]* 292
6.1.3 Ground type *[EC8, §3.1.2]* 292
6.1.4 Viscous damping 294
6.1.5 Behaviour factor q 294
6.1.5.1 Structural types *[EC8 §5.2.2.1]* 294
6.1.5.2 Regularity in plan *[EC8 §4.2.3.2]* 296
6.1.5.3 Regularity in elevation *[EC8 §4.2.3.3]* 297
6.1.5.4 Ductility classes *[EC8 §5.2.1]* 301
6.1.5.5 Basic value of the behaviour factor q_o *[EC8 §5.2.2.2]* 302
6.1.5.6 Failure mode factor k_w *[EC8 §5.2.2.2]* 304
6.1.5.7 Conclusion 304
6.1.6 Design spectrum of horizontal seismic actions *[EC8, §3.2.2.5 & §3.2.1(3)]* 305
6.1.7 Design spectrum of vertical seismic actions *[EC8, §3.2.2.5(5)]* 307
6.2 Dynamic analysis και natural periods of structure 308

6.3 Seismic stresses 311
6.3.1 Seismic accelerations 311
6.3.2 Seismic forces, shear forces, bending moments 312
6.3.3 Approximate method for the calculation of seismic accelerations *[EC8, §4.3.3.2.2]* 313
6.3.4 Cracking and plasticity effects 314
6.4 Applications 315
6.4.1 Frame type structure 315
6.4.2 Wall-equivalent dual type structure 322
6.4.3 Approximate analysis of the frame and wall type structures 328
6.5 Loading envelopes 330
6.6 Special cases 333
6.6.1 Columns not belonging in a diaphragm 333
6.6.2 Vertical component of seismic action *[EC8, §4.3.3.5.2]*

APPENDICES

APPENDIX A: MODELLING SLABS WITH FINITE ELEMENTS

A.1 Modelling slabs with finite elements in a structural frame 337
A.1.1 The frame behaviour in the regions close to columns 341
A.1.1.1 Model using members 341
A.1.1.2 Model with finite elements 343
A.1.1.3 First Conclusion 344
A.1.2 Deflection of beams 344
A.1.2.1 Model using members 355
A.1.2.2 Model using finite elements 348
A.1.2.3 Second Conclusion 351
A.1.3 Torsional stiffness of beams 351
A.1.3.1 Model using members 352
A.1.3.2 Model using finite elements 355
A.1.3.3 Third Conclusion 358
A.1.3.4 FINAL CONCLUSION 358

APPENDIX B: STIFFNESS OF MULTISTOREY PLANE FRAMES

B.1 Stiffness of frame crossbar 361
B.2 Equivalent multistorey frame – crossbar relative stiffness 363
B.3 Relative stiffness of crossbar column 364
B.4 Effect of slabs on stiffnesses using finite elements 365
B.5 Effect of walls on stiffnesses using finite elements 369

APPENDIX C: DIAPHRAGMATIC BEHAVIOUR OF ONE-STOREY SPACE FRAME – GENERAL CASE

C.1 Subject description 375
C.2 Axis transformation 377
C.3. Case 1: Translation of centre of stiffness C_T along x direction by δ_{xo} 379
C.4 Case 2: Translation of centre of stiffness C_T along y direction by δ_{yo} 381
C.5 Case 3: Rotation of the diaphragm by an angle θ_z about C_T 382
C.6 Torsional stiffness ellipse, torsional radii and equivalent system 384
C.7 Superposition of the three cases 386
C.8 Work Methodology 389
C.9 Expressions relating the initial system X0Y and the principal system xC_Ty 390
C.10 One-storey space frame with rectangular columns in random arrangement 390
C.10.1 Analysis using manual calculations, assuming fixed columns (k=12) 391
C.10.2 Analysis using the Excel file, assuming fixed-ended columns (k=12) 391
C.10.3 Analysis using the Excel file, assuming columns with k=6 392
C.10.4 Analysis using software, assuming actual beam and column torsional stiffnesses 392

APPENDIX D: DIAPHRAGMATIC BEHAVIOUR OF MULTISTOREY SPACE FRAME – GENERAL CASE

D.1 Subject description 395
D.2 General method for the calculation of the diaphragm i data 398
D.3 Diaphragm lateral stiffnesses 406
D.4 Diaphragm torsional stiffness 406
D.5 Torsional stiffness distribution 407
D.6 Equivalent system – Relative lateral stiffness – Relative torsional stiffness 408
D.7 Examples
